Introduction

This is the manual for the ConT_EXt-correspondence manual.

The module was written at the start as a package to write letters with a consistent and use to use interface and a few options to change the layout in a consistent way.

The core for the first version was based on the letter manual from Hans Hagen (`m-letter.tex`) and parts of this still remain in the low level code of the module.

As the time past more and more parts had been added to the package and it ended up in a similar interface as the L^AT_EX-classes but with it's own commands to set user values. Because of it's origin in Hans module the user interface and the low level parts are split in two different files and many more interfaces for the users are possible, one of them tries to mimic the style of Hans module.

As the time past the author wrote generic version of the complete setup commands and a few other in the letter core and created the new file `t-correspondence.tex` which holds now the low level code. As a result of this the new file `t-resume.tex` became part of the package with it's own setup commands and external style and interface files.

Introduction

Introduction

Part 1

Letters

Introduction

1.1 Beginners guide

The most important in the module for the users is the interface to write the letter text and to set the values for one or more letters.

You will learn how to write a letter with the module step by step, beginning with just a few lines of text, following with opening and closing sentences and at the end after you know how to set every kind of information you will finally learn how to change the position of the reference line and how to change the texts for the labels and to customise their style and color.

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

1.1.1 Pure text

To understand how a letter is written let's study the code for the example letter on the left page.

```
\usemodule[letter]

\starttext

\startletter
Thus, I came to the conclusion ...
\stopletter

\stoptext
```

As you could see from the first line the letter module has to be loaded before it could be used because it is none of the functions ConT_EXt provides by default, to make the examples in the following sections a little bit shorter I will no longer add `\usemodule`, `\starttext` and `\stoptext` but you shouldn't forget to add all of them in your files.

The content for your letter is written between the letter environment, it doesn't matter if you use blank lines before and after the letter text.

If you take a closer look at the result on the left side you could see the paragraphs are separated by blank lines, this could be changed with the `\setupletterstyle` command but let us keep this for later.

You're not restricted to only one letter in file, it is possible to write as many as you like in a file and you could use this to write serial letters but a easier method to do this is described later in the manual.

Dear Reader,

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

Greetings from the Author

1.1.2 Opening and closing

You saw in the last example how to write a simple text but shouldn't it be possible to give a few opening and also closing words for the letter, because the reader should know for whom the content is.

To achieve this the module provides the two variables *opening* and *closing*. To feed them with text you could either use the optional argument for `\startletter` as done in the current or you could set them before the content of the letter with the two commands `\setupletter` and `\setlettervalue`.

Let us begin with first alternative and set them as argument with `\startletter`:

```
\startletter
  [opening={Dear Reader,},
   closing={Greetings from the Author}]
Thus, I came to the conclusion ...
\stopletter
```

If you don't like this method you could set the two value before the letter environment with the `\setupletter` command, the text in your file should now look like:

```
\setupletter
  [opening={Dear Reader,},
   closing={Greetings from the Author}]

\startletter
Thus, I came to the conclusion ...
\stopletter
```

If you are more interested in a KOMA-Script like solution to set with every command only one value their is as last alternative the `\setlettervalue` command, it comes in two different versions where the keyword is either written in braces or in bracket but the content itself is written between braces.

The first version with braces for two values has the following look.

Beginners guide

```
\setlettervalue{opening}{Dear Reader,}  
\setlettervalue{closing}{Greetings from the Author}
```

The nearly no difference to the second version and both give the same result and you could the one which you prefer.

```
\setlettervalue[opening]{Dear Reader,}  
\setlettervalue[closing]{Greetings from the Author}
```

The values itself had to be given before the letter environment because values in the letter text are ignored and will never be shown in the output.

You have also to be careful with the content for the values because commas are interpreted as end of the value if you write it as argument for `\startletter` or with `\setupletter` and the text has to be protected with braces in this case but you don't need them if there is no comma in your text.

This could not happen if you set the values with the `\setlettervalue` command because the content is delimited by the braces and commas are just normal text.

Beginners guide

Step by step guide to write a letter

Dear Reader,

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

Greetings from the Author

1.1.3 Subject

After you read how to write the text and set values for the opening and closing we mention now how we could write a subject.

Instead of integrating this point in the last section I wrote a new to let you understand the system. Before I will tell more let's take a look at the code.

```
\startletter  
  [opening={Dear Reader,},  
   subject={Step by step guide to write a letter},  
   closing={Greetings from the Author}]  
Thus, I came to the conclusion ...  
\stopletter
```

The text for the subject is written as argument for *subject* as argument for `\startletter`, as you already guess you could have set it also with `\setupletter` or `\setlettervalue` and this is also possible and true for the values in the following sections.

Besides the *subject* you have also the option to set a *title* for the letter, there is no big difference between them but the title is normally written before the subject and has and use a slightly bigger size or is emphasized in another way.

Step by step guide to write a letter

Dear Reader,

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

Greetings from the Author

1.1.4 Address

Letter are normally meant to be send by post and to prevent you from writing the address by hand on the envelope you could buy envelopes with windows. To use these envelopes the address has to be written on the letter and to do this you have to set the *name* and the *address* for the addressee with the two values *toname* and *toaddress*.

The input for the example on the left page looks like:

```
\setupletter
  [toname={Mike Wilson},
   toaddress={Linden street 12\\78569 TeX City}]

\startletter
  [opening={Dear Reader,},
   subject={Step by step guide to write a letter},
   closing={Greetings from the Author}]
Thus, I came to the conclusion ...
\stopletter
```

The author prefer to set the values for the addressee not with `\startletter` but with `\setupletter` but this is just a matter of style and you could select what fits best to your own working style.

Step by step guide to write a letter

Dear Reader,

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

Greetings from the Author

1.1.5 Sender

It is not often enough to have just the addressee information on the letter, you're looking also for way to put the *name* and *address* for the sender into the header.

If you have wondered why the author hasn't just used *name* and *address* as keys for the addressee values you will now find the solution. To make the system consistent to set the values for addressee and the sender both needed key names to prevent confusions which value should use the the simpler and which one a more verbose one both got a prefix to the key to differentiate them, so got addressee information the prefix *to* and sender information the prefix *from*.

The additional input for the example on the left page to the one from the previous examples is:

```
\setupletter  
  [fromname={The Author},  
   fromaddress={Hidden Street 2\\57895 Mystery town}]
```

The manual will describe in a later section how to write a own header with a personal look and feel but this is outside of the user interface and requires knowledge about the layout.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

Greetings from the Author

1.1.6 Reference line

If you're in a company or a organisation you need sometimes a few extra information on your letter. The reference line or block is the right place where you can place these information.

Our old example from the last section was now extended by a reference line between the information from our addressee and the subject line, the information for the four fields were set with the following code.

```
\setupletter
  [name={Ben Johnson},
   phone={4922-89564},
   fax={4922-89564},
   date=\currentdate]

\setupletter
  [list={name,phone,fax,date}]
```

The first `\setupletter` set the content for the four fields *name*, *phone*, *fax* and *date*. Although the values are set none of them will appear in the output but we have to declare the fields for the reference line first, this is done in the second `\setupletter` command with the key *list*, the entries will appear in the in the same order as you write them in the list, if one or more of the keys in the list have no values they will still appear in the output but no content is shown.

If you change the content for the *list* key in your file the module will show by default the date of the current date at the right side of the reference line, this will normally always happen and you could say the result in the examples of the two preceding sections.

Arthur Thor

1.1.7 Signature

You know now how to set the letter text, the opening and closing lines, the values for the addressee and the sender and also how to define your own values for the reference line.

Most of the things needed for a letter are already told but a few fields at the end of the letter remain untold, the first line you will add to our example letter is the signature. It is set with the *signature* in the same way as the other values in the former examples. What the author did in the left example was:

```
\setupletter  
[signature={Arthur Thor}]
```

There is some space between the closing and the signature to give you the possibility to sign the letter also by hand after you have printed the letter.

You're not limited to simple text for the signature, it is also possible to use a graphic if you won't sign the letter by hand after you printed it, such a solution would have been for the author the next code.

```
\setupletter  
[signature={\externalfigure[autograph] [height=2\lineheight]}]
```

How to adjust the space between the closing line and the signature for this way will be shown in the letter style section.

Dear Prof. Reid:

I understand that you are having difficulties with Alka-Seltzer tablets. Since there are 25 pills per bottle, while the manufacturer's directions recommend ``plop, plop, fizz, fizz," my colleagues tell me that you have accumulated a substantial number of bottles in which there is one tablet left.

At present I am engaged in research on the potential applications of isolated analgesics. If you would be so kind as to donate your Alka-Seltzer collection to our project, I would be more than happy to send you preprints of any progress reports that we may publish concerning this critical problem.

Sincerely,

R. J. Drofnats

At present I am engaged in research on the potential applications of isolated analgesics. If you would be so kind as to donate your Alka-Seltzer collection to our project, I would be more than happy to send you preprints of any progress reports that we may publish concerning this critical problem.

Sincerely,

R. J. Dromats
Professor

Interface

1.3 Layout

The components for the letter can be divided in to groups, the first are letter layers, you can position them on the page wherever you want and it is also possible to put one layer bevor or behind another layer.

The underlying machanism behind letter layers are ConT_EXt's normal layer mechanism in combination with localframed environments, this is a very powerful combination and you could create complicated layouts with them.

The second group of components for the layout are letter sections, they are not as powerfule as letter layers and you have only a limited number of elements to control their layout.

```
\setupletterstyle [...,1...] [...,2...]
```

```
1 firstpage secondpage
2 inherits from \setuplayout
```

```
\setupletterstyle [1...] [...,2...]
OPTIONAL
```

```
1 option
2 marking          = yes no
  indenting        = inherits from \setupindenting
  whitespace       = inherits from \setupwhitespace
  backgroundcolor  = IDENTIFIER
  backgroundimage  = FILE
  header           = reset
  footer           = reset
  before           = COMMAND
  after            = COMMAND
  pagenumber       = NUMBER
  bodyfont         = 5pt ... 12pt small big
  alternative      = singlesided doublesided
  state            = start stop
```

[Redacted]

Layout

1.3.1 Letter layers

Layer are used to position elements one page independant of the page layout. They are used for the header and footer, address block¹ etc.

The complete list of all available layers is:

- head
- letternext
- lettermain
- foot
- address
- reference
- location
- nexthead
- lefthead
- righthead
- nextfoot
- leftfoot
- rightfoot
- topmark
- botmark
- cutmark
- endmark
- usermark
- backaddress

```
\setlayer[...]{\framed{...}}
```

The position and layout of the layers can be changed with the `\setupletterstyle` command.

```
\setupframed[...][...==...]
```

```
\setupletterstyle [...,1...] [...,2...] [...,3==...]
```

OPTIONAL

```
1  head foot nexthead nextfoot lefthead leftfoot righthead rightfoot  
   address backaddress reference location topmark botmark cutmark  
   endmark usermark letternext lettermain
```

```
2  frame
```

```
3  inherits from \setupframed
```

```
\setupplayer[...][...==...]
```

¹ The block styles use a different structure and use a letter section for the address block.

Layout

```
\setupletterstyle [...,1...] [...,2...] [...,3.,...]  
                                OPTIONAL
```

```
1  head  foot  nexthead  nextfoot  lefthead  leftfoot  righthead  rightfoot  
   address  backaddress  reference  location  topmark  botmark  cutmark  
   endmark  usermark  letternext  lettermain
```

```
2  layer
```

```
3  inherits from \setuplayer
```

```
\getparameters[...][...,...=...,...]
```

```
\setupletterstyle [...,1...] [...,2...] [...,3.,...]  
                                OPTIONAL
```

```
1  head  foot  nexthead  nextfoot  lefthead  leftfoot  righthead  rightfoot  
   address  backaddress  reference  location  topmark  botmark  cutmark  
   endmark  usermark  letternext  lettermain
```

```
2  option
```

```
3  state      =  start  stop  first  next  left  right  leftpage  rightpage  
                page  subpage  
   symbol     =  IDENTIFIER  
   style      =  normal  bold  slanted  boldslanted  type  cap  small...  
                COMMAND  
   color      =  IDENTIFIER  
   alternative =  IDENTIFIER  
   separator  =  IDENTIFIER  
   leftmargin =  DIMENSION  
   rightmargin = DIMENSION  
   spacebefore = DIMENSION  
   spaceafter  = DIMENSION
```

Layout

1.3.2 Letter sections

- letterhead²
- dateline²
- referenceline²
- specialnotation²
- insideaddress²
- title
- subject
- opening
- content
- closing
- appendices

You can change the layout of a letter section with the `\setupletterstyle` command, the syntax is:

```
\setupletterstyle [...1,...] [...,2.,...]
```

1 letterhead dateline referenceline specialnotation insideaddress title
subject opening content closing appendices

2 before = COMMAND
after = COMMAND
align = inner outer left right flushleft flushright middle
center normal no yes
style = normal bold slanted boldslanted type cap small...
COMMAND
color = IDENTIFIER
leftmargin = DIMENSION
rightmargin = DIMENSION
alternative = IDENTIFIER
separator = IDENTIFIER
command = \...#1
optimize = yes no

² Only used for the blockstyle layouts.

[illegible]

1.3.3 Letter descriptions

```
\setupletterstyle [...1,...] [...2,...]
```

```
1  postscript  copy  enclosure
```

```
2  location   = left right top text
```

```
width       = fit broad DIMENSION
```

```
distance    = DIMENSION
```

```
before      = COMMAND
```

```
after       = COMMAND
```

```
inbetween   = COMMAND
```

```
headstyle   = normal bold slanted boldslanted type cap small...  
              COMMAND
```

```
headcolor   = IDENTIFIER
```

Layout

1.4 Extensions

The letter module provides a special type of files, called extensions. They provide functions that could be used by different files like the labels for each language (`label.nle`) or extra features for one purpose like the page optimization (`optimize.nle`).

You can load extension files either with the letter module and write their names as argument to the extension key or afterwards in your file with the `useletterextension` command.

```
\useletterextension [...*...]  
  
* IDENTIFIER
```

The module comes itself with the following extensions:

label	Labeltexts for different languages
pragma	Example content for Hans own letter module
optimize	Increase or decrease the distance between paragraphs to fill a page with at least 25% of the text height

Extensions

1.5 Reference line

The reference lines is used to show information like the date and other information.

A few styles are predefined and you can select them with:

```
\setupletterstyle[reference] [alternative=...]
```

By default only the current date is shown in the reference line but you can change this with list key, you can give a single value or a comma list as argument.

```
\setupletterstyle[reference] [list=...]
```

For backward compatibility you could set both values also with the `\setupletter` command which are passed down to the `\setupletterstyle` command.

```
\setupletter  
  [alternative=...,  
  list=...]
```

Grund des Anschreibens

Sehr geehrte Damen und Herren,

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

Mit freundlichen Grüßen

1.5.1 Alternative a

The reference alternative a is enabled with the default style, the only value you can see is the date. The setup in the default style for the reference line is like this:

```
\setupletterstyle
  [reference]
  [alternative=a,
   list=date]
```

This leads to the following output, you get two lines which are aligned to the right side with a label in the current mainlanguage on the top line and the current date on the bottom line.

Date
June 29, 2009

You could also show more elements in the reference line when you write them as argument the list key.

```
\setupletterstyle
  [reference]
  [list={name,phone,date}]
```

The values are shown in the given order and spread across the line like below. To get this effect you need a list with at least two elements, otherwise it is moved to the right side like you can see in the first example.

1.5.3 Alternative c

```
\setupletterstyle
  [reference]
  [alternative=c,
   list=reference]
```

```
\setupletter[reference=\rightaligned{\currentdate}]
```

June 29, 2009

```
\setupletterstyle
  [reference]
  [alternative=c,
   list=reference]
```

```
\setupletter
  [reference=\line{\lettervalue{name}\hfill\lettervalue{date}}]
```

Willi Maier	June 29, 2009
-------------	---------------

You could also use the alternative c to create your own reference line.

The following example show you a way to create own similar the alternative a but now with a natural table and a hard coded order of the elements.

```
\setupletterstyle
  [reference]
  [alternative=c,
   list=reference]
```

```
\startsetups reference:customized
```

```
  \bTABLE[frame=off,offset=0pt,width=.25\hsize]
    \bTR
```

Reference line

```
\bTD \labeltext{letter:name} \eTD
\bTD \labeltext{letter:phone} \eTD
\bTD \labeltext{letter:fax} \eTD
\bTD \labeltext{letter:date} \eTD
\eTR
\bTR
\bTD \lettervalue{name} \eTD
\bTD \lettervalue{phone} \eTD
\bTD \lettervalue{fax} \eTD
\bTD \lettervalue{date} \eTD
\eTR
\eTABLE
```

`\stopsetups`

`\setupletter`
`[reference=\setups{reference:customized}]`

The code results in the following result.

Name	Phone	Fax	Date
Willi Maier	01234-56789	3456-9853	June 29, 2009

1.5.6 Alternative none

The last alternative none is different from the previous alternatives.

It disables the complete reference line and use as only alternative the values from layout for the first page to the distance till the first line of the letter while the other ignores this values and calculate it based on the position, height and distance after the reference line.

You choose in the same way as the other alternatives.

```

1.7 Letter Examples

The letter module consists not only of just the main module, it contains also a few already defined styles for different countries and each of them use slightly different position for the layers and other setups.

This section will give you an overview of all included styles you could use with the module without the need to write your own style.

Brand new templates for Word

Dear Mr Wilson,

Thus, I came to the conclusion that the designer of a new system must not only be the implementer and first large-scale user; the designer should also write the first user manual.

The separation of any of these four components would have hurt T_EX significantly. If I had not participated fully in all these activities, literally hundreds of improvements would never have been made, because I would never have thought of them or perceived why they were important.

But a system cannot be successful if it is too strongly influenced by a single person. Once the initial design is complete and fairly robust, the real test begins as people with many different viewpoints undertake their own experiments.

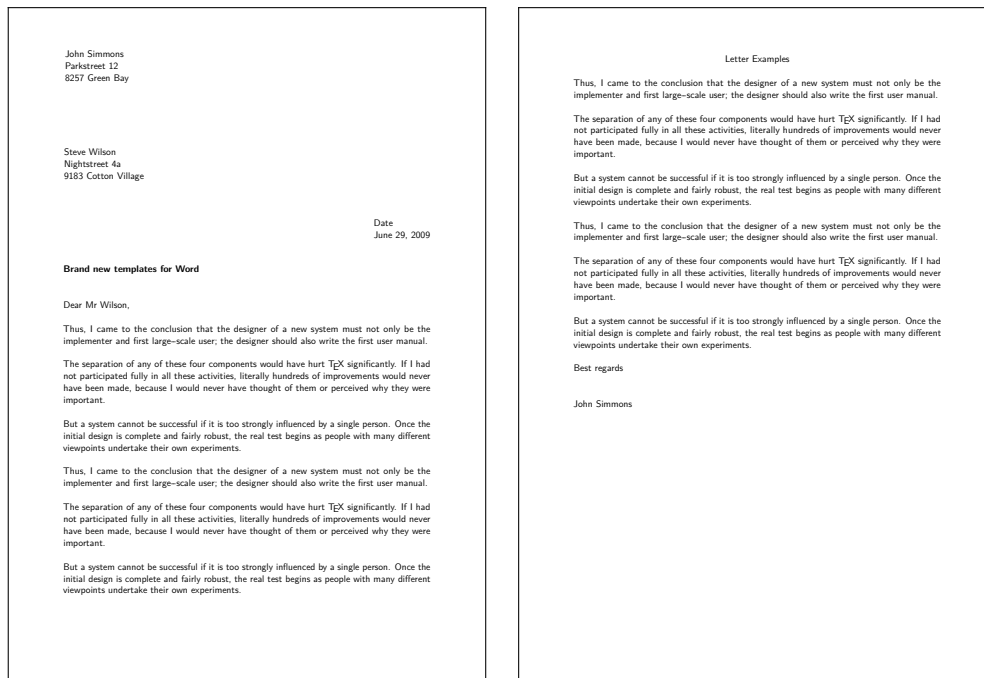

Best regards

John Simmons

Letter Examples

1.7.5 Full-block Style

The full-block format is the simplest of all six blockstyle formats. Every part of the letter starts at the left margin with a blank line between each part.

The order of the parts is date, inside address, attention line, salutation, subject line, body, complimentary close, signature and additional information.

Letter Examples

2.1 Interface

2.1.1 Default

```
\startresume [...,.*,...] ... \stopresume
                        OPTIONAL
*   inherits from \setupresume
```

2.1.2 moderncv

The moderncv interface is based on the layout of the moderncv-package for L^AT_EX and with the same elements and styles. The difference between the L^AT_EX and the ConT_EXt-version is that you don't need a `\maketitle` command to place the header for each style and it is placed by default.

The current implementation of the moderncv interface is written as resume style and not as interface, this means you load it with `\useresumestyle` or as argument for `\usemodule` with the style key.

The available elements for the interface are described below.

`\cvline`

The `\cvline` take two arguments, the first place the text in the left margin and accepts only short entries, the second argument accepts longer texts which are placed in the text area. You could change the distance after the entry with the optional argument.

```
\cvline{...}{...}
```

The two lines

```
\cvline{supervisors}{Supervisors}
\cvline{description}{\tx Short thesis abstract}
```

results in

```
supervisors  Supervisors
description  Short thesis abstract
```

Interface

`\cvlistitem`

The `\cvlistitem` is similar to the `\cvline` command above but it takes only one argument which is placed in the text area. In the left margin appear a symbol like a itemize, you could change this symbol with the optional argument before the text.

```
\cvlistitem[<symbol>]{...}
```

The two example line below

```
\cvlistitem{Item 1}  
\cvlistitem[+]{Item 2}
```

result in the following output

```
- Item 1  
+ Item 2
```

`\cvlistdoubleitem`

The `\cvlistdoubleitem` is a enhanced version of the `\cvlistitem` command and place two text side by side, if you change the symbol it affects the symbol for both texts.

```
\cvlistdoubleitem[<symbol>]{...}{...}
```

As you can see in the next example you have to write the text in two command if you want one below the other.

```
\cvlistdoubleitem[$\circ$]{Item 1}{Item 3}  
\cvlistdoubleitem[$\circ$]{Item 2}{Item 4}
```

You can see this in the output from the example above.

Interface

- Item 1
- Item 2
- Item 3
- Item 4

`\cventry`

The `\cventry` has six argument and prints the argument two to five in the first line of the text with a certain format for each text and separates them with commas. The first argument is typed in the left margin and the last in the text on a separate line.

```
\cventry{...}{...}{...}{...}{...}{...}
```

Two possible settings for the arguments are:

```
\cventry{year-year}{Degree}{Institution}{City}{\it Grade}{Description}
```

```
\cventry{year-year}{Job title}{Employer}{City}{}{Description}
```

This results in the time period in the left margin and the information in the text.

year-year **Degree, Institution, City, Grade.**
 Description

year-year **Job title, Employer, City.**
 Description

`\cvlanguage`

The `\cvlanguage` behaves also like the `\cvline` command but take a third argument which can be used for additional information in the right margin.

```
\cvlanguage{...}{...}{...}
```

The following example

Interface

```
\cvlanguage{language 1}{Skill level}{Comment}  
\cvlanguage{language 2}{Skill level}{Comment}
```

results in:

language 1	Skill level	<i>Comment</i>
language 2	Skill level	<i>Comment</i>

`\cvcomputer`

The `\cvcomputer` command is an enhanced version of the `\cvlistdoubleitem` with two explicit arguments for the label text which is written on the left of each entry.

```
\cvcomputer{...}{...}{...}{...}
```

As you can see in the first and third arguments a label is written to describe the text category of each entry.

```
\cvcomputer{category 1}{XXX, YYY, ZZZ}{category 3}{XXX, YYY, ZZZ}  
\cvcomputer{category 2}{XXX, YYY, ZZZ}{category 4}{XXX, YYY, ZZZ}
```

This produces the following output.

category 1	XXX, YYY, ZZZ	category 3	XXX, YYY, ZZZ
category 2	XXX, YYY, ZZZ	category 4	XXX, YYY, ZZZ
